

OSHAX plus InfoHUBX Safety Compliance Guaranteed

All companies operating in Canada and the US are required to provide record of a pre-shift safety check before commissioning the lift truck into operation. This protects the employees of the company operating the lift trucks and ensures that the vehicle itself is mechanically sound. If a company fails to maintain a record of compliance fines are levied against the company as well as senior officers responsible for the operation. With OSHA and Ministry audits simply inevitable the rating or effectiveness of that pre-shift record can cost a company a lot in the form of penalty and insurance premiums. Quite surprising is the fact that in this day and age with the availability of technology the main form of record for pre-shift vehicle safety checks is STILL paper. Paper is not automatic, gets lost and has no accountability. While inexpensive paper actually costs companies more than it saves. For years IVDT has been manufacturing systems with automatic pre-shift safety checks built in. For those companies just interested in gaining control of their pre-shift obligation we manufacture OSHAX. The system as soon as it is powered on recognizes if that vehicle has a completed safety with an assigned operator responsible for the inspection. If not the lift truck will illuminate with a color strobe and sound alarm to indicate that the vehicle is operating without a completed safety check. The safety check itself is OSHA and Mistry compliant and walks the operator through

the required questions to complete the check required to pass or fail the mechanical operation of the vehicle. The system installs in approximately 1 hour with only two wires and an indicator.

Is automatic and easy to use and provides 100% pre-shift vehicle safety compliance as the data is stored in the CPU and extracted via USB perfect for single forklift operations.

InfoHUBX OSHA: With the effectiveness of the OSHAX companies that want to save time and money utilize IVDT's InfoHUBX integration. InfoHUBX is a communication gateway that connects the OSHAX to your network, so the data compliance is easily accessible when required. This eliminates the need to physically visit the lift truck and brings the information directly to you saving valuable time. With an interactive portal that allows users to sort based on vehicle or operator, shift or safety outcome the InfoHUBX maintains 100% compliance displaying records in real time as it happens. The InfoHUBX will even send an email to operation managers when a vehicle fails a safety actioning a corrective measure or secondary inspection. With no monthly fees and or security risks the system is easily compatible with all networks. It is so effective that many companies who have introduced OSHAX on their forklift fleet have introduced it on other vehicles such as lift tables, loaders, aerial equipment anything that requires an operator.
